Background: This project is focused on the Gressier and Leogane communes, which are located west of Port-au-Prince in the Ouest Department of Haiti. It serves as a basis for learning about the community in order to proceed with grant-funded projects in a way that both satisfies the grant stipulations and benefits the community.

Methods: A survey was conducted through random selection of 129 students from the four schools selected for participation in the cholera grant.

Results: A total of 112 surveys were completed; data management was conducted in excel in order to organize demographic and living conditions information obtained through the survey.

Discussion: The results of this project will allow for improved planning for future needs assessments and surveys in this area. Additionally, the logistics for the nurse home visits will be informed by the information gathered and the lessons learned from this project.
